Background

Why Indirect Treatment Comparisons

Our Vision

Why do we need this tool

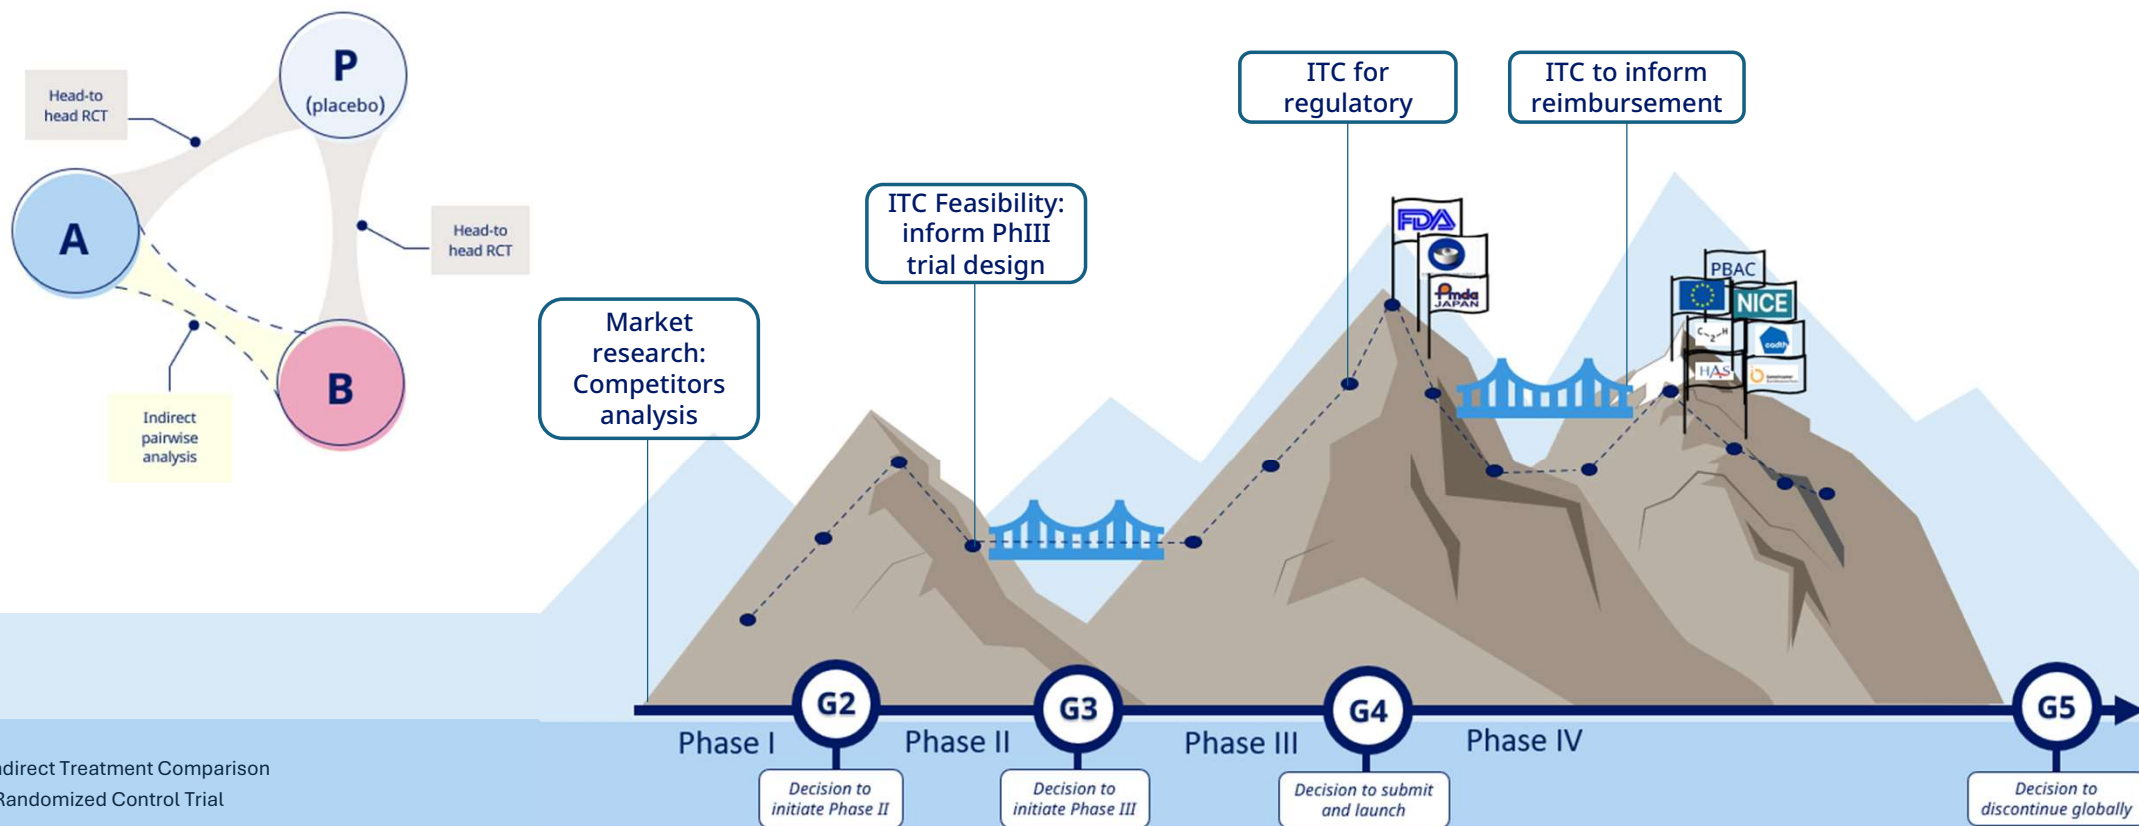

Our Code

Our R-Shiny app

Improvements & Aspiration

Why Indirect Treatment Comparisons

ITC app to **standardize, scale** and **accelerate** delivery of results

Our Vision

Improved communication

Facilitated Collaboration

Ideal state: Tool able to generate submission-ready reports

Streamlined HTA Submissions

By consolidating data input, statistical analysis, and visualization, the ITC app enhances the efficiency of our processes, *minimizing errors* and *accelerating* the delivery of innovative solutions to patients.

Customization

Reproducibility

Compliance

Our code

Feasibility

Modelling

Welcome to the ITC App

This interactive tool is designed to help you along the process of generating indirect evidence through **Network Meta Analysis**.

Getting Started

To get started, upload your data file using the bar  **Input Data** on the sidebar Menu. The data should be in a csv file, and it must be in a long format.

Data Requirements

To ensure the app functions correctly, your dataset must include the following columns:

- trial** : Name of the clinical trial conducted.
- Assigned.treatment** : The treatment assigned to an arm within the trial. If the user wants to consider two treatments ('trtA' and 'trtB') as equivalent, this variable should already take it into account and re-assign them a common name ('trtAB').
- Dose** : The amount of treatment administered.
- Dose.unit** : The unit of measurement for the dose.
- Baseline** : Y/N values, identifies if a measurement was taken at baseline (i.e., 'timepoint_weeks' = 0).
- Variable** : The specific variable being measured. This column will include both endpoints and baseline characteristics. Endpoints can be identified as measurements in correspondence of rows with **Baseline = N**.
- Variable.category** : For continuous outcomes, this could include 'min, max, mean, se'. <!-- TODO: add binary outcomes -->
- type** : Indicate here if it's **cfb** (change from baseline) or other.
- Variable.unit** : The unit of measurement for the variable.
- Variable.value** : The value obtained for the variable.
- timepoint_weeks** : The time point of measurement in weeks.
- Numbers.analysed** : The number of subjects analyzed at the specified time point.
- Estimand** : The target of estimation defined in the trial's objectives.

A data set is deemed ready for analysis once the following processes are completed:

- Type Conversions** : Ensuring correct data types for variables and standardizing units (e.g., for dose, variable units, timepoints correctly converted to weeks).
- Imputations** : Addressing missing values with 'NA' indicators.
- Filtering** : Removing duplicates and identifying outliers.
- Label Corrections** : Amending any incorrect labels.
- Analysis Flags** : Highlighting specific data for attention during analysis.

Please ensure that your dataset meets these requirements before uploading it to the app.

App Navigation

In the  **Input Data** tab, you can explore the uploaded data through a dataset view and several visualizations.

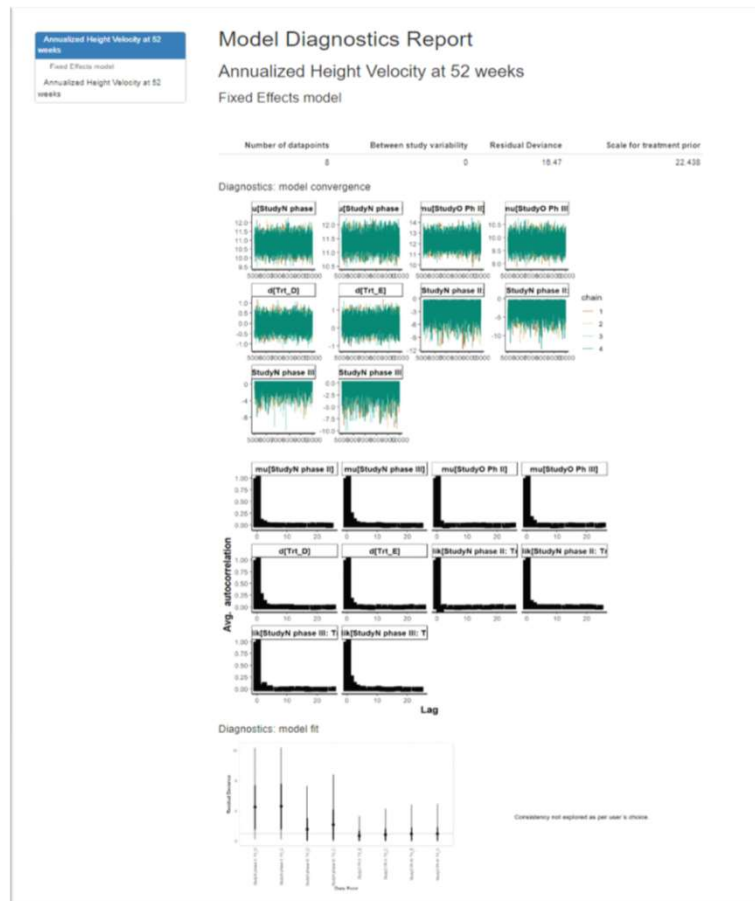

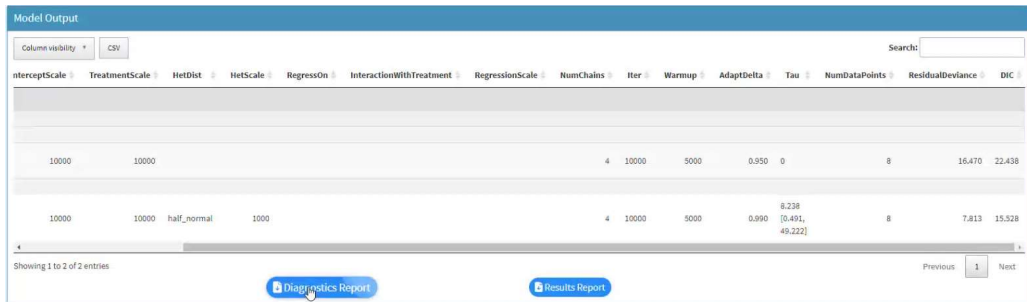

In the  **Feasibility** tab, you can explore heterogeneity in the baseline characteristics (within and between trials) and fit meta-analysis on the edges of the networks selecting specific outcomes of interest.

Lastly, you have a  **Modelling** tab, where you can select an outcome of interest and fit anchored ITCs, with fixed or random effects. The tool gives some flexibility for the choice of parameters during modelling. For instance, the user can provide the scale for the specific priors, the number of chains, etc.

While you use the app, make sure to read notifications and hover over information buttons  to get some help.

Learn More

If you want to read more about Indirect Treatment Comparisons, please have a look at the [online course](#) created by AXRO AGTR MQIV.

Current Improvements

Led by use cases & stakeholder engagement

- Additional endpoints types (binary, survival)
- Standardization of Targeted/Systematic Literature Review
- Development of customized outputs tailored to HTA bodies
- Standalone code generation
- Open sharing with stakeholders, training programs

Technical Development

- Develop the app as an R package

Future Aspirations

Collaborative Growth

- Gathering feedback through conference presentations
- Exploring opportunities for collaboration to enhance tool capabilities and reach

Open-Source Initiatives

- Explore open-source possibilities
